

Assignment-1

1. Introduction:

This assignment is regarding the backend service of an application using node modules and express framework. It is more faster than other application and database like mongodb make it more accurate and faster.

2. Expected List of Features:

It will help out the description of items fetched from database and show them on html pages. We used put, post, get, delete action and used postman for testing the rest APIs. This application will perform through Rest APIs which make it more robust and scalable.

3. Market Survey

We visited many websites and applications and we came to know that it will work more faster and accurate. We used Node.js as backend service and express framework to support static html pages.
